

CSR Shift Logger

A structured shift-logging system. Each CSR records every action through a quick pop-up form; their KPIs update live; the CEO sees the whole team in real time on a separate, private console.

Pop-up logging

Live KPIs

Two separate dashboards

Supabase realtime

Two surfaces, one live database

CSRs log on one app. The CEO/Manager watches on a separate, private console. Both talk to the same Supabase database, so every action a CSR submits appears on the manager's screen instantly.

Why it's built this way

- **Self-contained.** No sheets, no ClickUp pulls — the CSRs' entries are the only source.
- **Role-separated.** Two URLs, two passcodes. CSRs never reach the manager console.
- **Live.** Supabase Realtime pushes each new entry to the manager instantly.

How one CSR shift runs, end to end

Start a session, log each action through a pop-up as it happens, edit freely, then submit to check out. The summary is generated — never typed.

Starting a shift

No accounts to manage. The CSR picks who they are, which shift, and which profile they're on. Time is stamped automatically in Pakistan time.

Start shift

What's captured

- **Name, Shift, Profile** — three dropdowns, nothing typed.
- **Check-in** auto-stamped the moment they press Start.
- **Date** auto-filled. No CSR ID, no login to remember.

Shift windows · PKT

- **Morning** — 09:00 → 17:00
- **Evening** — 17:00 → 01:00
- **Night** — 01:00 → 09:00

Logging an action — the pop-up

Press “ + ” on any action, a small window opens with just that action's fields, fill it, press OK — and it's added. Fast, no page changes.

AGENDA

Scope & timeline for rebrand...

Cancel OK

How it feels

- The form shows **only the fields for that action** — nothing irrelevant.
- OK adds it to today's log and bumps that KPI **instantly**.
- No navigation away — the CSR stays on the dashboard the whole shift.

Every action has its own short form

- **Meeting** → client · type · **agenda**
- **New inquiry** → username · **agenda**
- **Project assigned** → client · designer · **project** · **due date**
- **Spam** → **username**

The live shift dashboard

The CSR's home for the whole shift: action buttons, KPI tiles that climb as they log, and today's editable log. This is the “dashboard for the CSR.”

Submit shift & check out

Live & automatic

- KPI tiles **climb instantly** as actions are logged — no totals typed.
- Every entry shows in **today's log**, newest first, with its key detail.

Editing

- Tap any entry to fix or update it (e.g. an order came in for that client).
- Editing never changes check-out** — only the Submit button does that.

Checking out

One button ends the shift. It's the only thing that records the check-out time, so the worked hours stay accurate no matter how much editing happened.

The full action catalog

Every action your CSRs report today, as its own button. Grouped so the dashboard stays tidy;
violet = required field.

Shift metrics & housekeeping

A few things aren't per-action — they're filled once before checkout. These come straight from your current reports (Impressions/Clicks, CRM, ClickUp clearance...).

NUMBERS (TYPED ONCE)

0

IMPRESSIONS

CLICKS

Why separate

- These are shift totals, not events — so they're single fields, not buttons.
- Optional: leave blank if a profile doesn't track them.

DONE-CHECKS (TOGGLES)

CRM updated

ClickUp cleared

Portfolio updated

Analytics checked

Order-by-order checked

A separate, live console

A different app at a different link, behind its own passcode. It shows every CSR's KPIs updating in real time — and CSRs can't open it.

How the separation works

- **Two apps, two passcodes.** CSR app = team passcode; console = manager passcode.
- The console link isn't shown anywhere in the CSR app.
- Supabase rules let CSRs **write** their own entries but **not read** the console's team-wide view.

What the CEO sees

- Live totals + a row per CSR, filterable by **shift / profile / date**.
- Numbers move the instant a CSR submits an action — no refresh.

Data model & how it's wired

Two tables, one realtime database. Type-specific fields live in a flexible column so adding a new action later never needs a schema change.

● Data model notes

- One **session** per CSR per shift (name · shift · profile · check-in/out).
- One **activity** row per logged action; its fields sit in details.
- KPI counts = `count(activity) group by type` — generated, never typed.

● Stack & realtime

- **React + Vite + Tailwind** on Vercel — two builds (CSR app, Manager console).
- **Supabase** Postgres + Realtime + row-level security.
- CSR submits → row inserted → Realtime pushes it to the console **instantly**.
