

CSR Shift Logger

A STRUCTURED SHIFT-LOGGING APP. EVERY CSR ACTION CAPTURED THROUGH A DEDICATED FORM THE MOMENT IT HAPPENS — NO FREE-TEXT NOTES, NO PULLING FROM ANY SHEET OR CLICKUP. THE SHIFT SUMMARY WRITES ITSELF.

THE COMPLETE FLOW

How a shift works, end to end

One CSR, one shift. They start a session, log each action through its own form as it happens, edit anything later, then check out — and the summary is generated automatically.

WHAT GETS LOGGED

Action catalog

Each action is one button on Shift Home and one focused form. Confirmed set is from your brief; candidates are the extra categories your current daily reports already contain — tell me which to include.

Confirmed — from your brief Candidate — confirm to include violet field required

CSR Shift Logger — System Design

HaseebMadelt · for approval

WHY ENTRIES ARE EDITABLE

The inquiry lifecycle

Entries aren't frozen. The key case: an inquiry that becomes an order later. That one editable field is what makes conversion measurable — with zero external data.

HOW IT'S STORED

Data model

Three tables. One session per CSR per shift; many activities per session; type-specific fields live in a flexible details column with the queryable bits pulled out.

WHAT THE CSR SEES

Screen preview

Three core screens. Start the shift, log actions from the hub, fill one short form per action.

HOW IT'S WIRED

Architecture

Decisions to approve

Six choices lock the design. My recommendation is marked on each.

1 • Storage backend **Recommend: Supabase**

A shared backend is required (many CSRs writing, one combined view). Supabase = hosted Postgres, instant APIs, no servers to run.

2 • Action catalog

The 6 confirmed are in. Which of the 6 candidates (new order, delivery, assigned-to-designer, extension, completed, spam) become buttons too?

3 • Sign-in **Recommend: name + team passcode**

Pick-your-name + one shared passcode to open the app (light). Or per-CSR login (stronger attribution, a bit more friction).

4 • Edit window **Recommend: same business day**

Entries editable through the current shift / business day, then locked — so history stays trustworthy.

5 • Check-in time **Recommend: auto**

Auto-stamped on "Start shift", check-out auto on submit. (Or let them type it.)

6 • CEO dashboard

Build the CSR input app first (Phase 1), add the CEO/lead read-dashboard as Phase 2 — or both together?

Next: approve this flow (or redline it), answer the six above, and share the full list of actions your CSRs actually do — then I build Phase 1: the input app, Supabase schema, and the auto-summary. Nothing is built until you say go.
